

Coding Contribution Statement

Factory Inventory & Production Management System (MVP)

Role Name: Nisal Dulneth Wickramaarachchi (Start up manager)

Assigned Coding Responsibility: Rest of the project

Primary ownership outside the allocated role-specific areas

- Overall application bootstrap, workspace structure, environment handling, server composition, and runtime setup across the monorepo.
- Master data and operations outside the allocated products, suppliers, reports, and authentication responsibilities, including wholesalers, GRN, BOM, batches, orders, dispatches, audit, dashboard behavior, and deployment/runtime hardening.
- Most of the inventory movement logic, production management behavior, FEFO dispatch flow, delivery-note integration wiring, seeding, and deployment configuration.

Relevant frontend work

- Application shell and role-aware navigation in client/src/app and client/src/app/MainLayout.tsx.
- Operational pages for wholesalers, GRN, BOM, batches, orders, dispatches, dashboard, audit, and related workflow screens in client/src/pages.
- Batch create and complete flow in client/src/pages/Batches.tsx, order and dispatch UI, dashboard behavior, and general end-to-end inventory workflow wiring.
- Deployment-aligned client behavior such as route handling and environment-driven API usage.

Relevant backend work

- Core app composition in server/src/app.ts together with module registration, middleware order, CORS handling, and API surface assembly.
- Database models and modules supporting wholesalers, GRN, BOM, batches, orders, dispatch, audit, stock snapshots, stock movement tracking, and traceability.
- FEFO allocation logic in server/src/utils/fefo.ts, dispatch processing, production completion logic, seed workflow in server/src/seed.ts, and runtime/deployment files such as server/api/[...path].ts and server/vercel.json.
- Release hardening work tied to the remaining system areas, including routing, deployment behavior, and integration stability.

Supporting implementation work

- Owned the practical integration of the project as a working MVP, ensuring that the non-assigned areas operate together across stock-in, production, order handling, dispatch, PDF delivery notes, audit, and environment setup.
- Provided the main technical continuity across modules so the project remains coherent beyond the four specifically assigned contribution areas.
- Served as the primary programmer for the remaining implementation workload and the person responsible for keeping the whole system buildable, testable, and demo-ready.

Conclusion

This coding ownership is documented as the main-programmer contribution to the rest of the project beyond the four assigned areas, covering the majority of system implementation, integration, operational workflows, infrastructure setup, and release readiness work.
