

Quality Plan - Sprint 2

Project: Factory Inventory & Production Management System (MVP) Role: Quality Manager
Sprint: 2 Version: 1.0

1. Purpose

Define quality controls for core MVP implementation covering backend correctness, UI flow reliability, and data traceability.

2. Quality Objectives

- ? Ensure API response format consistency: { success, data?, error? }.
- ? Validate RBAC enforcement for OWNER, EMPLOYEE, WHOLESALER roles.
- ? Verify inventory integrity across GRN, production, and dispatch transitions.
- ? Confirm auditability through AuditLog and StockMovement.

3. Scope Under QA

- ? Server modules: users, products, suppliers, wholesalers, GRN, BOM, batches, orders, dispatch, reports, audit.
- ? Client pages: dashboard, master data screens, GRN, BOM, batches, orders, dispatches, reports, users, audit.
- ? Seed and setup workflow for local demo reproducibility.

4. Verification Approach

- ? Static checks: linting and schema review.
- ? Automated tests: unit tests for FEFO and BOM logic + integration flow checks.
- ? Manual scenarios: role-based end-to-end walkthrough from login to dispatch PDF.

5. Entry/Exit Criteria

Entry: core routes compiled, seed data available, basic UI wiring complete. Exit: no critical flow blocker in auth, stock mutation, dispatch, or reporting.

6. Sprint 2 Quality Outcome

Quality baseline established with automated FEFO/BOM assertions and role-aware manual flow checks; deployment quality controls planned for Sprint 3.
