

QA Validation Report - Sprint 3

Deployment Validation Findings

1) Server Runtime

- ? Serverless adapter and config were introduced successfully (server/api/[...path].ts, server/vercel.json).
- ? Initialization strategy reduced repeated bootstrap overhead.

2) Routing Validation

- ? Identified unstable behavior on nested API routes in production (/api/orders/my path-specific miss observed).
- ? Client SPA refresh behavior improved after client/vercel.json rewrite updates.

3) Environment Validation

- ? Confirmed deployments are sensitive to exact env value formatting (notably CORS origins and API base URL).

Defect Summary

- ? High: nested API route mismatch under Vercel (targeted for Sprint 4).
- ? Medium: production troubleshooting documentation needed to reduce triage time.
- ? Low: minor UX consistency gaps not blocking release candidate.

Recommendation to Team

Proceed to Sprint 4 only with hardening backlog: route mapping, CORS preflight verification, and final lint/UI cleanup.
